1. The International Primary curriculum is an idea that began in Britain, 8 years ago. Today, this curriculum is taught in more than 1000 primary schools in 58 countries, including the US. Educator Martin ~~Skeleton~~ Skelton co-wrote ~~cowrote~~ the International Primary curriculum, or IPC. He says for children to learn and succeed, they need a program that permits them to learn individually. He says the idea with the curriculum is to help today's children become good citizens of the world and 21st century leaders. He says most of world problems are going to be solved internationally. No single country is going to solve the environment or terrorism. Mr. Skelton says the curriculum has activities built around the development of international mindedness, starting ~~to~~ from the age of 3. The British American School of Los ~~Angelous~~ Angeles is one of a few American private schools that teach the International Primary curriculum. Second grade teacher Allison ~~Kerl~~ Keir says the main goal is to engage children in the learning process. Another educator, Kate Foy of the British School in Washington, says the teacher's role is to enable students to discover for themselves

2. In 2008, nearly 6000 Americans died in crashes involving drivers who were busy doing something other than driving. Wane Irving is a developer of computer software. He created a software program to help people resist the urge to use their cell phone while driving. Irving calls his software the SMS Replier. It lets drivers get control of their smartphones while driving. The phone sends a message informing callers that the person is busy driving and cannot answer. The SMS Replier is only one of many programs that have been created to reduce traffic accidents. For example, the Ford Motor Company is putting one such program in some of its car models to help young drivers. Parents can use a message center on the car to limit its speed. It can also sound warnings if the driver fails to wear a seatbelt. Brain Benny of Ford says the system gives parents peace of mind. Parents don't have to buy a car with built-in technology to control their children's driving. They can add a device to their presen car that continously watches how their children drive. A recording will tell drivers when they speed, drive aggressively, or forget to wear their seatbelt. The device can inform parents if the driver continues to demonstrate risky driving behavior.

3. In the early 1950s, researchers found that people scored lower on intelligence tests if they spoke more than one language. Research in the 1960s found the opposite. So which is it? Researchers presented their newest studies in Fabruary at a meeting of the American Association for the Advancement of Science. The latest evidence shows that being bilingual doesn't necessarily make people smarter. But researcher Ellen Bialystock says it probably does make you better at certain skills. And the answer she says is that ~~bill biligua~~ bilingual people are often better at controlling their attention, a function called the executive control system. Bilingual work shows that bilingual people continually practice this function. They have to, because both languages are active in their brain at the same time. They need to surpress one to be able to be able to speak in the other. This mental exercise might help in other ways, too. Researchers say bilingual children are better able to seperate a word ~~for~~ from its meaning and more likely to have friends from different cultures. Bilingual adults are often 4 to 5 years later than others in developing dementia or Alzhemiere's ~~diseases~~. Alzheimer's disease.

4. Farmers in the US have grown genetically engineered crops since the ~~latte~~ late 1990s. A company, Aqua Bounty Technologies, has developed the Aqua Advantage Salmon. The fish is an Atlantic salmon that contains genes from 2 other kinds of fish, ocean pout and Chinook salmon. With these genes, it can grow twice as fast Food and Drug Administration says there would be no need for special labeling if the salmon is found to have the same basic contents as other fish. But critics say the genetically changed salmon is different from other fish. They say if the FDA approves it for sale, people should be told what they're buying. Winona Hodder of the activist group Food and Water Watch says the Aqua Advantage Salmon has not been studied enough for food safety. Ms. Hodder worries that the farmed fish could escape into waterways and reproduce with wild populations. Then she says the idea could spread to other countries. But the company says most of its fish are raised at inland fish farms And it has promised the Food and Drug Administration that it would only market female salmon unable to reproduce.

5. Old age may not sound exciting, but recent findings offer good news for old people and for people worried about getting older. Researchers ~~find~~ found that people become happier and experience less worry after they reach the age of 30. In fact, they say by the age of 85, people are happier with their life than they were when they were 18 years old. The ~~res~~ researchers asked questions about emotions like happiness sadness and worry. The also asked about mental or emotional stress. The findings showed that stress levels dropped sharply after people reached their 60s. Happiness was highest among the ~~yo~~ youngest adults and those in their early 70s. The people least likely to report feeling negative emotions were those in their 70s and 80s. Researchers say they do not know why happiness increases as people get older. One theory is that as people grow older, they grow more thankful for what they have and have better control of their emotions. They also spend less time thinking about bad experiences. The researchers also considered possible influences like having young children, being unemployed or being single. But they found that influences like these didn't affect the levels of happiness and well-being related to age.
